PROFESSIONAL SUMMARY

Applied AI & Analytics Engineer specializing in spec-driven multi-agent orchestration and automated data infrastructure. Proven ability to replace manual reporting workflows with deterministic LLM pipelines using FastAPI, DuckDB, and LangGraph. Focused on architecting governed analytical engines that solve high-value business problems by treating AI as an execution engine bounded by strict programmatic constraints.

TECHNICAL CAPABILITIES

AI Orchestration: LangGraph, Gemini API, Groq API, Multi-Agent StateGraphs, Spec-Driven System Design

Data Infrastructure: SQL (BigQuery, MySQL, DuckDB), Python (Pandas, Scikit-Learn), Staging-to-Clean Modeling

Backend & Frontend: FastAPI, React 19, TypeScript, Streamlit

Applied Analytics: Funnel Serialization, Cost-Benefit Matrix Integration, RFM Segmentation, SLA Routing Logic

ENGINEERING & ANALYTICS PROJECTS

Vizzy: Automated BI Orchestration Engine

FastAPI, React 19, DuckDB, Groq API

- Engineered a spec-driven multi-agent framework utilizing FastAPI, React 19, and DuckDB to build an automated analytics orchestration engine, achieving fully deterministic JSON execution plans and optimized execution latency.

DNA: Autonomous Desktop Automation Agent

Gemini API, Python

- Engineered an autonomous desktop automation system powered by the Gemini API and speech-to-text integration, utilizing structured JSON execution planning to accurately map and execute sequential multi-step tool workflows.

Revenue Leak Detection & Funnel Analysis

BigQuery SQL, Python, Tableau

- Identified \$1.14M+ in systemic e-commerce revenue leakage—including an \$835K desktop-specific leak—by serializing dynamic user session behavior in BigQuery SQL and isolating a 73,961 session drop-off at the Product View to Add to Cart stage.

Customer Churn Prediction & Business Impact System

Scikit-Learn, Streamlit

- Maximized corporate retention campaign ROI by training Scikit-Learn classification models with 24 hypothesis-driven features and deploying a dynamic cost-benefit threshold sweep to optimize financial yield over raw statistical accuracy.

Customer Lifecycle Intelligence Platform

Python, Streamlit, Plotly

- Developed a modular, rule-based Python data engine with integrated quality gates to convert raw transactional data into a 100% auditable corporate decision framework, delivering real-time RFM segment insights and normalized risk scores.

Support SLA & Operational Performance Analysis

Advanced Excel, Conditional Logic

- Exposed an 88.43% SLA breach rate on urgent tickets and an associated 86.02% satisfaction drop on reopened cases by modeling a structured operational routing matrix using multi-conditional data infrastructure.

EDUCATION

M.I.E.T Engineering College | Tiruchirappalli, India

Expected Jun 2026

Bachelor of Technology – Information Technology

- Core Focus:** Big Data Analytics, Machine Learning, Database Management Systems.
- Publication:** Co-authored research paper on the Vizzy LLM-Powered Analytics Agent, published in the International Journal for Research in Applied Science & Engineering Technology.
